the 1990s, the number of people in the world who are under 15 years of age is expected to increase by 1.5 billion (United Nations, 1994). The United Nations also predicts that the number of people aged 65 and over will increase by 1.5 billion in the same period (United Nations, 1994). The rapid increase in the number of people in the world is expected to have a significant impact on the environment, particularly in the areas of water, land, and air pollution. The United Nations has identified several key areas of concern, including the need to protect the environment, to improve the quality of life, and to ensure the sustainable development of the world (United Nations, 1994).

## Discussion

## Background

1. *Chlorophyll a* (Chl *a*) is the primary photosynthetic pigment in most plants and algae. It is a green pigment that absorbs light energy in the blue and red regions of the visible spectrum.

Figure 1. The effect of the concentration of the *Agrobacterium* suspension on the transformation efficiency of *Agrobacterium* strains. The number of transformed cells was determined by the number of colonies growing on the selective medium. The results are the mean of three independent experiments. Error bars represent the standard deviation.
